No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

inhibiting the proliferation of normal human dermal fibroblast cells. PRO polypeptides such as PRO6004, PRO4981, PRO7174, PRO5778, PRO4332, etc., are useful for detecting the presence of tumour in a mammal which are useful for detecting the presence of tumour in a mammal which compared to the sample of calls taken from the mammal, and a control sample of normal cells of the same cell type, where a higher level of expression of the PRO polypeptides in the test sample as compared to the control sample of is indicative of the presence of tumour in the mammal. The tumour is lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour, olon tumour, breast tumour, prostate tumour, rectal tumour or useful as molecular weight markers for tissue typing, or as therapeutic agents. A polynucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful configuration animals or knock-out animals which are useful configuration animals or knock-out animals which are useful configuration animals or knock-out animals which are useful substitution and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and transmembrane PRO polypeptide. \mathcal{S}

polypeptide (1). rkuyst, rkulley, rkulley, carterior of cr gene expression in caseful for stimulating the proliferation of or gene expression in pericyte cells. PRO257, PRO229, PRO1272 or PRO4405 polypeptide are useful for stimulating the proliferation or differentiation of chondrocyte cells. PRO257, PRO255, PRO1305 or PRO1419 polypeptide are useful for stimulating the release of tumour necrosis factor (TNF) are useful for stimulating the release of tumour necrosis factor (TNF) are useful for stimulating the release of tumour necrosis factor (TNF) pro157, PRO357, PRO351, PRO1035, PRO1080, PRO1419, P tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour. (I) is useful as molecular weight markers, for tissue liver tumour or as therapeutic agents. A polyancleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful for generating useful reagents. PRO357, PRO252, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and polypeptide (I) PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are transmembrane PRO polypeptide.

Ź

Novel human secreted and transmembrane protein PRO10196.

Human; secreted and transmembrane protein; PRO; cytostatic; vulnerary; antiarthritic; pericyte cell proliferation; pericyte cell differentiation; chondrocyte cell proliferation; chondrocyte cell differentiation; tumour necrosis factor alpha release; (TNF)-alpha release; dermal fibroblast cell proliferation;

The invention describes an isolated PRU (secreted and transmemorane)

CC polypoptide (1). PRO982, PRO1160, PRO1187 or PRO1329 polypoptide are useful for stimulating the proliferation of or gene expression in useful for stimulating the proliferation of or gene expression in constitution the proliferation of or gene expression in pericyte cells. PRO357, PRO125, PRO1136, PRO136 or PRO1419 polypoptide are useful for stimulating the proliferation or differentiation of chondrocyte calpha from human blood. PRO982, PRO3136, PRO1366 or PRO1419, PRO1419, PRO1314, PRO1316, PRO1316, PRO1316, PRO1319, PRO1314, P tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour. (I) is useful as molecular weight markers, for tissue typing, or as therapeutic agents. A polynucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful screening useful reagents. PRO259, PRO229, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and New isolated nucleic acid encoding a secreted and transmembrane polypeptide (PRO), for use in recombinantly producing a PRO polypeptide, as a hybridization probe, and in gene therapy. Gerritsen ME, Goddard A, Godowski PJ; Smith V, Stephan JF, Watanabe CK, Wood WI; tumour; The invention describes an isolated PRO (secreted and transmembrane) dermal fibroblast cell differentiation inhibitor; tumour; lung colon tumour; breast tumour; prostate tumour; rectal tumour; liver tumour; tissue typing; chromosome mapping; gene mapping; Claim 11; Fig 78; 308pp; English. 01-JUN-2001; 2001WO-US017800. 29-JUN-2001; 2001WO-US021066. 09-APR-2002; 2002US-00119480. 13-AUG-2002; 2002US-00219070. 25-JUL-2000; 2000US-0220666P. tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour. (I) is useful as molecular weight markers, for tissue liver tumour. (I) is useful as molecular weight markers, for tissue useful or as therapeutic agents. A polyamucleotide (II) encoding (I) is useful for generating transgenic animals or knock-out animals which are useful for generating useful reagents. PRO357, PRO252, PRO1572 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and transmembrane PRO polypeptide.
is indicative of the presence of tumour in the mammal. The tumour is lung

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polymucleotides encoding them. The PRO polypucleotides encoding them. The PRO polypucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, retain tumour or liver tumour, in a mammal, for stimulating the release of tumour necrosis factor (TMF)-alpha from human blood, for stimulating the proliferation of differentiation of conditoryte cells, for stimulating the proliferation of or gene expression in perioyte cells or for stimulating the proliferation of or gene expression in perioyte cells or for stimulating the proliferation of normal human dermal fibroblasts. The PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating anticense RNA and DNA, in preparing PRO polypeptides by recombinant technology, in generating transgenic animals or knock-out animals which markers and in generating probes. The PRO polypeptides, or anti-PRO markers and in generating probes. The PRO polypeptides, or anti-PRO antibodies, such as perioyte-associated tumours and home and/or cartilage antibodies, such as perioyte-associated tumours and home and/or cartilage antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            disorders (e.g. arthritis, sports injuries), involving inducing the redifferentiation of chondrocytes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated PRO polypeptide useful for tissue typing, as molecular weight markers in protein electrophoresis, for treating arthritis, tumor.
                                                                                                                                                                                                                                                                                                               Gerritsen ME, Goddard A, Godowski PJ;

WPI; 2003-801154/75. N-PSDB; ADC49827.

ĸ New secreted and transmembrane PRO polypeptide useful for preparing medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, e.g. cancer.

Claim 11; SEQ ID NO 78; 314pp; English.

Life invention unsuscribed an isolated fro (sected and Laimmentaine) polypeptide (I). PR0982, PR01812 or PR01329 polypeptide are useful for stimulating the proliferation of or gene expression in pericyte cells. PR0357, PR02259, PR01272 or PR04405 polypeptide are useful for stimulating the proliferation of differentiation of chondrocyte cells. PR0357, PR0725, PR01155, PR01306 or PR01419 polypeptide are useful for stimulating the release of tumour necrossis factor (TMP)-care useful for stimulating the release of tumour necrossis factor (TMP)-care useful for stimulating the release of tumour necrossis factor (TMP)-care useful for stimulating the release of tumour necrossis factor (TMP)-care useful for stimulating the PR0357, PR01037, PR01036, PR01419, PR01419, PR01186, PR01181, PR01881, PR018881, PR018888881, PR01 The invention describes an isolated PRO (secreted and transmembrane)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polynucleotides encoding them. The PRO polypeptides and polynucleotides are useful as pharmaceuticals, diagnostics, biosenosis or bioreactors. They are particularly useful for diagnostics, biosenosis or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TMP)-alpha from human lood, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells or for stimulating the proliferation of or gene or normal human dermal fibrollasts. The PRO nucleic acids are useful as normal human dermal fibrollasts. The PRO nucleic acids are useful as antisense RNA and DNA, in preparing PRO polypeptides by recombinant technology, in generating transgenic animals or knock-out animals which

may be used in the development and screening of therapeutically useful reagents, in gene therapy, in chromosome identification, as chromosome markers and in generating probes. The PRO polypeptides, or anti-PRO antibodies, are useful for preparing a medicament for treating a condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sporte injuries), involving inducing the redifferentiation of chondrocytes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CSFRELLLEDGYNVYQSEAHGLPLHLPGNKSPHRDPAPRGPARFLPLPGLPPALPEPPGI 180

Claim 11; Fig 78; 308pp; English.

The invention describes an isolated PRO (secreted and transmembrane)

CC polypeptide (I). PR0982, PR01160, PR01187 or PR01129 polypeptide are useful for stimulating the proliferation of or gene expression in periotyte cells. PR0357, PR0229, PR01272 or PR04405 polypeptide are useful for stimulating the proliferation of differentiation of chondrocyte cells. PR0357, PR0725, PR01155, PR01196 or PR01419 polypeptide are useful for stimulating the proliferation or differentiation of chondrocyte cells. PR0331, PR0982, PR0353, PR01255, PR01306 or PR04419, PR0419, PR0214, PR0247, PR0337, PR0526, PR0363, PR0537, PR0725, PR01306, PR0419, PR01419, PR0214, PR0247, PR0337, PR0526, PR0363, PR01083, PR01244, PR01340, PR01349, PR01340, PR01340, PR01340, PR01341, PR01360, PR01344, PR01360, PR01344, PR01360, PR01343, PR01376, PR01360, PR01383, PR01344, PR01360, PR01383, PR01343, PR01380, PR01381, PR01380, PR01 tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour. (I) is useful as molecular weight markers, for tissue typing, or as therapeutic agents. A polynucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful screening useful reagents. PRO257, PRO229, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and transmembrane PRO polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polypuble encoding them.

Transmembrane polypeptides and polypublecetides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours fe.g. huma tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TMF)-alpha from human blood, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene capression in pericyte cells or for stimulating the proliferation of or gene or probes, in chromosome and gene mapping, in generating are useful as hybridisation probes, in chromosome and gene mapping, in generating cantisense RNA and DNA, in preparing PRO polypeptides by recombinant centionogy, in generating transgenic animals or knock-out animals which reagents, in gene therapy, in chromosome identification, as chromosome condition which is responsive to the PRO polypeptides, or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the re-

The invention describes an isolated PRO (secreted and transmembrane)

CC polypeptide (1). PRO982, PRO1160, PRO1187 or PRO129 polypeptide are
polypeptide (1). PRO982, PRO1160, PRO1187 or PRO129 polypeptide are
cc useful for stimulating the proliferation of or gene expression are
cc lis. PRO317, PRO329, PRO3120, PRO419 polypeptide are useful
cc ells. PRO317, PRO357, PRO7125, PRO1190 polypeptide
are useful for stimulating the release of tumour necrosis factor (TNP)
are useful for stimulating the release of tumour necrosis factor (TNP)

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polymucleotides encoding them. The PRO polypeptides and polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TNF) -alpha from human blood, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene cormal human dermal fibroblasts. The PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating transgenic animals which may be used in the development and screening of therapeutically useful reagents, in generating probes. The PRO polypeptides by recombinant reagents, in generating probes. The PRO polypeptides, or anti-PRO antibodies, are useful for preparing medicament for treating a methodies, are useful for preparing a medicament for treating a condition which is responsive to the PRO polypeptides or anti-PRO condition which is responsive to the PRO polypeptides or anti-PRO condition which servers and in the development and propess or anti-PRO condition which is responsive to the PRO polypeptides or anti-PRO condition which servers and surgeness and the properties or anti-PRO condition which servers and surgeness and servers and surgeness and servers and surgeness and servers and server antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the redifferentiation of chondrocytes. The PRO polypeptides are useful as Wood WI; molecular markers for protein electrophoresis, and in tissue typing. sequence represents a human PRO polypeptide of the invention. ```
Novel isolated PRO polypeptide useful for tissue typing, gene therapy, as molecular weight markers in protein electrophoresis, for treating
condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducting the redifferentiation of chondrocytes. PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LEIREDGTVGGAADQSPESLLQLKALKPGVIQILGVKTSRFLCQRPDGALYGSLHFDPEA 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          transmembrane polypeptides) and the PRO polymucleotides encoding them.

transmembrane polypeptides) and the PRO polymucleotides encoding them.

The PRO polypeptides and polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumnours (e.g. lung tumnour, colon tumnour, brast tumnour, prostate tumnour, rectal tumnour necrosis factor (TMP)-alpha from human blood, for stimulating the proliferation or differentiation of conductoryte cells, for stimulating the proliferation of or gene expression in pericyte cells or for stimulating the proliferation of or gene normal human dermal fibroblasts. The PRO nucleic acids are useful as normal human dermal fibroblasts. The PRO nucleic acids are useful as normal human dermal fibroblasts may proparing to hypeptides by recombinant antisense RNA and DNA, in preparing PRO polypeptides by recombinant technology, in generating transgenic animals of therapeutically useful reagents, in generating probes. The PRO polypeptides, or anti-PRO markers and in generating probes. The PRO polypeptides, or anti-PRO markers and in generating probes. The PRO polypeptides, or anti-PRO antibodies, are useful for preparing a medicament for treating a matibodies, are useful for preparing a medicament for treating a

are useful for stimulating the release of tumour necrosis factor (TNF)-
alpha from human blood. PRO362, PRO357, PRO725, PRO1306, PRO1419, PRO214,
PRO247, PRO337, PRO526, PRO363, PRO5619, PRO1806, PRO1419, PRO1414,
PRO1478, PRO1134, PRO8126, PRO1106, PRO1909, PRO1071, PRO1411, PRO1309,
PRO1025, PRO1181, PRO1126, PRO1186, PRO1192, PRO1244, PRO1374, PRO1340,
PRO1387, PRO1376, PRO1347, PRO1340, PRO1474, PRO1340, PRO1340,
PRO1887, PRO4936, PRO494, PRO4333, PRO3444, PRO4322,
PRO1887, PRO6079, PRO9836 or PRO10096 polypeptide are useful for
stimulating the pro11feration of normal human dermal fibroblasts cells.
PRO5723, PRO5725, PRO7154, or PRO7425 polypeptide are useful for inhibiting the proliferation of normal human dermal fibroblast cells.
                                                                                                                                                                                                                                                                                                                                                                                             polypeptides such as PRO6004, PRO4981, PRO7174, PRO5778, PRO4332, etc., are useful for detecting the presence of tumour in a mammal which involves comparing the level of expression of the above PRO polypeptides in a test sample of calls taken from the mammal, and a control sample of normal cells of the same cell type, where a higher level of expression of the PRO polypeptides in the test sample as compared to the control sample is indicative of the presence of tumour in the mammal. The tumour is lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour. (I) is useful as molecular weight markers, for tissue tryping, or as therapeutic agents. A polynucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful is useful leagents. PRO327, PRO229, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ransmembrane PRO polypeptide

Novel human secreted and transmembrane protein PRO10196 ADB78297 standard; protein; 208 (first entry) 04-DEC-2003 ADB78297; RESULT 24

Z

Human; secreted and transmembrane protein; PRO; cytostatic; vulnerary; antiathritic; perioyte cell proliferation; chondrocyte cell differentiation; chondrocyte cell differentiation; tumour necrosis factor alpha release; (TNF)-alpha release; dermal fibroblast cell proliferation; dermal fibroblast cell differentiation inhibitor; tumour; lung tumour; colon tumour; breast tumour; prostate tumour; rectal tumour; liver tumour; chongone mapping; gene mapping; gene therapy

polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1129 polypeptide are useful for stimulating the proliferation of or gene expression in useful for stimulating the proliferation of or gene expression in pericyte cells. PRO357, PRO225, PRO1155, or PRO4105 polypeptide are useful for stimulating the proliferation of or gene expression in cells. PRO31, PRO357, PRO1155, PRO1306 or PRO1419 polypeptide are useful for stimulating the release of tumour necrosis factor (TMF)-alpha from human blood. PRO982, PRO3137, PRO1305, PRO1419, PRO1314, PRO1317, PRO1305, PRO1181, PRO1181, PRO1181, PRO1181, PRO1181, PRO1182, PRO1181, PRO1881, PRO1981, PRO1981 tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour. (I) is useful as molecular weight markers, for tissue ryping, or as therapeutic agents. A polymucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful is useful leagents. PRO357, PRO259, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and Wood WI; New isolated PRO polypeptide useful for tissue typing, gene therapy, amolecular weight markers in protein electrophoresis, and for treating the invention describes an isolated PRO (secreted and transmembrane) Godowski PJ; Goddard A, Goucher TR. WPI; 2003-657982/62. N-PSDB; ADB80673 One hundred and twenty two nucleic acids encoding PRO polypeptides, useful in gene therapy, chromosome identification, tissue typing, or hybridization probes in chromosome and gene mapping.

Claim 11; Fig 78; 305pp; English.

The invention describes an isolated PRO (secreted and transmembrane)

polypeptide (I) PRO982, PRO1160, PRO1197 or PRO1329 polypeptide are

colsusful for stimulating the proliferation of or gene expression in

perioryce cells. PRO357, PRO222, PRO1272 or PRO4405 polypeptide are useful

cor stimulating the proliferation of differentiation of chondrocyte

cells. PRO31, PRO357, PRO72, PRO1155, PRO1306 or PRO1419 polypeptide

are useful for stimulating the release of tumour necrosis factor (TMF)
cells. PRO31, PRO357, PRO357, PRO725, PRO1106, PRO1419, PRO214,

PRO130, PRO3134, PRO326, PRO3105, PRO3176, PRO1244, PRO1116, PRO1186,

PRO143, PRO337, PRO1126, PRO1186, PRO1197, PRO1141, PRO1309,

PRO143, PRO337, PRO136, PRO1186, PRO1197, PRO1141, PRO1309,

PRO136, PRO1381, PRO357, PRO1186, PRO1197, PRO1411, PRO1309,

PRO136, PRO1381, PRO356, PRO1186, PRO1193, PRO1444, PRO13124,

PRO1364, PRO327, PRO9836 or PRO1086, PRO1273, PRO1444, PRO1312,

PRO1364, PRO529, PRO9836 or PRO10805 polypeptide are useful for

cryptogrides such as PRO6004, PRO4333, PRO3444, PRO3414,

PRO523, PRO375, PRO7184, PRO19197, PRO1486, PRO432,

CROMINIATING the proliferation of normal human dermal fibroblast cells.

CROMINIATING the proliferation of normal human dermal fibroblast cells.

CROMINIATION of the proliferation of normal human dermal fibroblast cells.

CROMINIATION of the proliferation of normal human dermal fibroblast cells.

CROMINIATION of the proliferation of normal human dermal fibroblast cells.

CROMINIATION of the proliferation of normal human dermal fibroblast cells.

CROMINIATION of the proliferation of normal human dermal fibroblast cells.

CROMINIATION of the same cell type, where a higher level of expression of the above PRO polypeptides in the test sample of cells taken from the mammal, and a control sample tumour, breast tumour, prostate tumour, rectal tumour of tumour, breast tumour, prostate tumour, rectal tumour of tumour, breast tumour, prostate tumour, rectal tumour of the mammal properties of suseful for transing beneful transmembrane PRO polypeptide.

Sequence 208 AA;

The invention describes an isolated PRO (secreted and transmembrane) polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are useful for stimulating the proliferation of or gene expression in pericyte cells. PRO359, PRO229, PRO122 or PRO4405 polypeptide are useful for stimulating the proliferation or differentiation of chondrocyte cells. PRO351, PRO355, PRO1155, PRO1306 or PRO1419 polypeptide

Claim 11; Fig 78; 308pp; English.

arthritis and tumors.

```
1;
 invention may have cytostatic activities through the stimulation of chondrocytes. The nucleic acids of the invention may be useful for the manufacture of a medicament for diagnosing or treating a tumour in a mammal. In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present sequence is the amino acid sequence of a human PRO protein of the invention
                                                                                                                                                                                                                                                                             LEIREDGTVGGAADQSPESILQLKALKPGVIQILGVKTSRFLCQRPDGALYGSLHFDPEA 120

The invention describes an isolated PRO (secreted and transmembrane)

polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1229 polypeptide are

to useful for stimulating the proliferation of or gene expression in

pericyte cells. PRO327, PRO222, PRO11272 or PRO4405 polypeptide are useful

for stimulating the proliferation or differentiation of chondrocyte

cells. PRO3131, PRO325, PRO1185, PRO1186 or PRO1419 polypeptide

are useful for stimulating the release of tumour necrosis factor (TNR)-

alpha from human blood. PRO982, PRO3157, PRO1260, PRO1419, PRO214,

The present invention describes a method for the reduction of mortality and morbidity in critically ill patients, which involves the administration of fibroblast growth factor 21 (FGF-21) (1). (1) has antinflammatory, respiratory, antibacterial, immunosuppressive, vasotropic, heemostatic and nephrotropic activities, and an insulin solution elevation regulator. a glucose uptake stimulator, and an insulin ensity enhancer. (1) can be used in the manufacture of a medicament for the reduction of morbidity and mortality in critically ill patients suffering from systemic inflammatory response syndrome (SIRS), respiratory distress, acute lung injury, response syndrome (SIRS), respiratory distress, acute lung injury, acute respiratory distress syndrome, multiple organ dysfunction syndrome, sepsis and chronic cobstructive pulmonary disease (e.g. emphysema and chronic bronchitis). The SIRS includes pancreatitis, isothemia, multiple trauma and tissue injury, haemorrhagic shock, immune-mediated organ injury, shock and renal disease. STAT regulates glucose levels in response to sepsis; reduces morbidity and mortality that occurs in critically ill patients, and stimulates glucose uptake and enhances insulin sensitivity. The present sequence represents the human FGF-21 amino acid sequence, which is given in the exemplification of the present invention.
Use of fibroblast growth factor 21 for reduction of mortality and morbidity in patients suffering from e.g. systemic inflammatory response syndrome and acute respiratory distress syndrome.
                                                                                                                                                                                                                                                             Disclosure; Page 15-16; 22pp; English.

This invention relates to one hundred and twenty two novel nucleic acids encoding human PRO membrane bound proteins or receptors. Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information received from other cells and the immediate printenance. The information is often transmitted by secreted printenance. The information is often transmitted by secreted polypeptides (for example mitogenic factors, survival factors, cytotoxic polypeptides (for example mitogenic factors, survival factors, cytotoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse cell receptors or membrane bound proteins. These membrane bound proteins and receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor liquand interactions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins, along with the cDNA sequences encoding them. The novel proteins of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gerritsen ME, Goddard A, Godowski PJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel isolated PRO protein encoding nucleic acid. The nucleic acid of the invention may be useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence of a useful in a mammal. Furthermore, the molecules of the invention may be useful for stimulating proliferation or gene expression in pericyte cells, the release of tumour necrosis factor (TNF)-alpha from human blood, the proliferation or differentiation of chordrocyte cells and for inhibiting the proliferation of normal human dermal fibroblast cells. Finally, the molecules may be utilised during gene therapy. The current sequence is that of the human PRO protein of the invention

The invention relates to an isolated nucleic acid encoding a PRO polypeptide. Nucleic acids that encode PRO can be used to generate either transgenic animals or knock-out animals useful in developing and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy for replacing defective gene, in chromosome identification, as chromosome markers, or in generating probes to isolate till length PRO cDNA. The PRO polypeptides are useful for chondrocyte stimulation, TNF-alpha stimulation, human dermal fibroblasts stimulation and for detecting the presence of tumour in an mammal. The PRO polypeptides are useful as molecular markers for protein electrophoresis and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing, Anti-PRO antibodies are useful in diagnostic assays for pro and in affinity purification of PRO from recombinant cell culture or natural sources. The present sequence represents the amino acid sequence of a human secreted/transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           119

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ð
                                                                                                                                                                                                                                                                            The present sequence represents human fibroblast growth factor 21 (FGP-21). FGF-21 is located to chromosome 19, more specifically to 19q13.1-qter. The present invention describes a method for treating a mammal exhibiting type 2 diabetes or type 1 diabetes, or treating a mammal for obesity which comprises administering to the mammal a composition comprising FGF-21 which has at least 95% amino acid sequence dientity to the 20% amino acid sequence given in ABP96156. Also described: (1) inducing an increase in glucose uptake in adipocyte cells by administering FGF-21 to induce an increase in glucose uptake, and (2) manufacturing a medicament for treating type 1 diabetes, type 2 diabetes or obesity in a mammal using FGF-21 having 95% amino acid sequence identity to ABP96156. FGF-21 has antidiabetic and anorectic activities. The method is useful for treating a mammal exhibiting type 2 or 1 diabetes or for treating a mammal exhibiting type 2 or 1 diabetes or for treating a mammal for obesity. The method is preferably useful for treating humans exhibiting type 1 or type 2 diabetes, and for treating domestic animals for obesity per 1 or type 2 diabetes, and for treating domestic animals for obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    4

The invention relates to a novel isolated nucleic acid encoding a fully defined PRO polypeptide. The molecules of the invention may be useful for stimulating proliferation or gene expression in pericyte cells or the release of TMF-alpha from human blood. Other possible uses include the stimulation or inhibition of chondrocyte proliferation or differentiation, the stimulation of human dermal fibroblast cell proliferation and the detection of the presence of a tumour within a mammal. Furthermore, the nucleic acid may be useful for the manufacture of a medicament for diagnosing or treating a tumour within a mammal or a medicament for detecting the expression of an associated gene, as well as during gene therapy. The current sequence is that of the human PRO protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120

tully defined in the specification; or (b) any of 122 nucleotide sequences having e.g. 4834, 2504 or 1759 bp fully defined in the specification; or (b) any of 122 nucleotide sequences having e.g. 4834, 2504 or 1759 bp fully defined in the specification; or the full length coding sequence of any these 122 nucleotide sequences. The RNO polypeptides or polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are community breast tumour, prostate tumours (e.g. lung tumour, or liver tumour) in a mammal, for stimulating the release of TNF-alpha from human blood, or commal human dermal fibroblast proliferation of fiferentiation of chondrocyte cells, for stimulating proliferation of pericyte cells, or for modulating normal human dermal fibroblast proliferation. The RNO nucleic acid or polypeptide is also useful in drug screening, particularly as targets or arthritis or wounds. The RNO polypeptides are useful in drug screening, particularly as targets for the presence of these diseases, and in the diagnostic determination of the presence of these diseases. The RNO polypeptides are useful as molecular weight markers, or for cheromosome contential in drug screening, particularly as targets indentification. The RNO genes are useful as hybridiation probes, or for screening libraries of human cond, genomic DNA or mRNA. The RNO genes may also be used in gene therapy, particularly for replacing a defective consuments and the sequence of a novel human secreted and transmembrane RNO polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                encoding novel human secreted and transmembrane (PRO) polypeptides. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, agerelated macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, ungina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120 CSFRELLLEDGYNVYQSEAHGLPLHLPGNKSPHRDPAPRGPARFLPLPGLPPALPEPPGI 179

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the diagnosis and treatment of tumours. Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABM80739-ABU80860 represent the human PRO polypeptides of the invention. Note: The sequence

The invention relates to an isolated human polypeptide (1) for zFGF11 (a fibroblast growth factor), and the encoding polymucleotide (II). (I) and (II) are used in methods of the invention stimulating proliferation of mesenchymal cells, detecting the presence of zfGF11 in a biological sample, detecting the presence of FGFRIIC in a biological sample and stimulating proliferation of osteoblastic lineage cells. The polypeptides, nucleic acid and/or antibodies of the invention may be used in treatment of deseneration, amyotrophic lateral sclerosis, cerebrovascular stroke, neuropathy associated with diabetes mellitus, neural cell development or deseneration, amyotrophic lateral sclerosis, cerebrovascular stroke, neuropathy associated with lack of maintenance of neuronal development. Molecules of the nervous system or lack of neuronal development. Molecules of the invention may also be useful for improving cardiac function and for promoting wound healing of the epidermis. The present sequence represents the amino acid sequence of
                                                                                      Human; fibroblast growth factor; FGF; zFGF11; mesenchymal cell; FGFRIIIc; osteoblastic lineage cell; diabetes mellitus; neuropathy; neural cell development; amyotrophic lateral sclerosis; cerebrovascular stroke; neuronal differentiation; congenital disorder; nerrous system disorder; cardiac function; wound healing.
                                                                                                                                                                                                                                                                                                                28. .208

The present invention relates to new extracellular messenger polypeptides and polynucleotides encoding them. XMES is useful in the diagnosis, treatment and prevention of neurological disorders (e.g. epilepsy, stroke, or Alzheimer's disease), autoimmune/inflammatory disorders (e.g. encoders), acquired immune deficiency syndrome, AIDS, Addison's disease, or allergies), developmental disorders (e.g. renal tubular acidosis, anaemia or Chring's syndrome), endocrine disorders (e.g. hypophysectomy, aneurysm or vascular malformation), and cell proliferative disorders (e.g. cancer), and in the assessment of the effects of exogenous or compounds on the expression of nucleic acid and anino acid sequences of extracellular messengers. XMES may also be used in the treatment of viral, bacterial, fungal, parasitic, protozoal and helminthic infections, trauma, disorders associated with hypopituitarism, the properthyroidism or gonadal steroid hormones, and pancreatic disorders such as type I or type II diabetes mellitus. The XMES may be used for somatic or germine gene therapy. The present sequence is human XMES-3 protein
                                                                                                                                                                                                                                                                                                                                                                           Human; extracellular messenger; neurological disorder; epilepsy; XWES-3; Alzheimer's disease; autoimmune disorder; renal tubular acidosis; stroke; acquired immune deficiency syndrome; AIDS; Addison's disease; cytoetatic; developmental disorder; anaemia; Cushing's syndrome; endocrine disorder; vascular malformation; cell proliferative disorder; gene therapy; cancer; neuroprotective; trauma; hypopicuitarism; hypothyroidism; antihelminthic; hyperthyroidism; gonadal steroid hormone; pancreatic disorder; nootropic; diabetes mellitus; immunosuppressive; anti-inflammatory; antibacterial; antiviral; antifungal; parasitic; protozoal; allergy.

sclerosis, cerebrovascular stroke, neuropathy associated with lack of sclerosis, cerebrovascular stroke, neuropathy associated with lack of maintenance of neuronal differentiation and congenital disorders of the nervous system or lack of neuronal development, promoting angiogenesis and wound healing, for revascularisation in eye, complications related to poor circulation such as diabetic food ulcers, improving cardiac function, modulating surfactant production in the lung epithelium, to reduce damage to the tissue caused by ischaemia or ischaemia-reperfusion events, particularly in the heart or brain and for inducing skeltal amuscle neogenesis and/or hyperplasia, kidney regeneration and/or for treating of systemic and pulmonary hypertension. Antagonists of 2FGFII are useful for inhibiting disorders associated with kidney epithelium

The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polynucleotides encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, especially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in perioyre cells, for stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating or inhibiting the proliferation of normal human dermal fibroblast cells. The PRO polypeptide may also be used as molecular weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. PAU833713 represent human PRO protein sequences of the invention
                                                                                                                                                                                                                                                                                                                                                     One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for treating a PRO related disorder and for diagnosing tumors such as lung cancer, colon cancer, breast tumor, prostate tumor, rectal tumor or liver tumor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a human shgFGF-19a polypeptide. The polypeptide is a member of fibroblast growth factor family of polypeptides. The polymucleotides and polypeptides are useful in the treatment of diseases such as stroke, traumatic brain injury, cerebral ischemia, cancer, atherosclerosis, rheumatoid arthritis, cirrhosis, psoriasis, sarcoidosis, idiopathic pulmonary fibrosis, tumour developmental disorders, skeletal disorders, wound repair, and acrocephaly. They are also useful as vaccines for inducing an immunological response in a mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 MDSDETGFEHSGLWVSVLAGLLLGACQAHPIPDSSPLLQFGGQVRQRYLYTDDAQQTEAH

The present sequence is that of human JAFFA, a novel member of the fibroblast growth factor family. Analysis of rare sequences in the Milennium datebase led to the identification of an expressed sequence tag from a buman prostate tumour library which coded for a novel typothetical signal peptide. Further analysis led to the identification of JAFFA, The invention provides JAFFA polypeptides, polymoleocides and anti-JAFFA antibodies. It also provides antisense mucleic acid molecules, recombinant expression vectors, host cells and transgenic animals. JAFFA proteins may be useful for developing novel diagnostic and therapeutic proteins may be useful for developing novel diagnostic and therapeutic agents for JAFFA-associated disorders such as cancers and other disorders which demonstrate ABO(H) blood group disorders and for controlling cellular proliferative and/or differentiative disorders. The JAFFA conclein may be used to treat and/or diagnose a variety of immune disorders such as autoimmune disease and multiple sclerosis. The proteins may also be used to screen for naturally occurring JAFFA substrates, to screen for drugs or compounds which modulate JAFFA antibodies, which can be used to detect and isolate JAFFA proteins, regulate the bioavailability of JAFFA proteins and modulate JAFFA activity.
                                                                                                                                                                                                                   Isolated JAFFA nucleic acid molecules which encode novel fibroblast growth factor family members (JAFFA) are useful for developing novel diagnostic and therapeutic agents for JAFFA-associated disorders such as
                                                                                                                                                                                                                                                                                                                                                       Claim 2; Fig 1; 137pp; English.

The sequence represents a fibroblast growth factor-like (FGF-like)

polypeptide. FGF-like protein and its associated nucleic acid play a role
in modulating body growth, maturation or life-span. They are also usseful
for treating, preventing or ameliotating disorders such as cirrhosis,
inflammatory bowel disease, mucositis, Crohn's disease, diabetes,
cobseity, gastrointestinal abnormalities, neurodegenerative diseases,
damage to renal tubules as a result of acute tubular necrosis,
camage to renal tubules as a result of acute tubular necrosis,
haematopoietic cell reconstitution following chemotherapy, wasting
syndromes (e.g., cancer associated cacheria), damage to the corneal
cepithelium, lens or retinal tissue, multiple sclerosis, myopathies, short
steture, delayed maturation, excessive growth (e.g. acromegaly),
conchopulmonary dysplasia, acute respiratory distress syndrome, tumours
cof the eye or other tissues, atherosclerosis, hypercholesterolemia,
cof the eye or other tissues, atherosclerosis, hypercholesterolemia,
cof the eye or other tissues, atherosclerosis, decreased stamina, decreased
cardiac function, immune system dysfunction, cancer, Parkinson's disease,
senile dementia, Alzheimer's disease, and decreased cognitive function chemotherapy; corneal epithelium damage; retinal tissue damage; myopathy; multiple sclerosis; short stature; delayed maturation; excessive growth; acromegaly; premature maturation; alopecia; bronchopulmonary dysplasia; androgen target organ abnormality; respiratory distress syndrome; stroke; cancer; atherosclerosis; hypercholesterolaemia; osteoporosis; baldness; desteoathritis; muscle atrophy; sarcopenia; withles; increased fatigue; decreased stamina; decreased function; immune system dysfunction; parkinson's disease; Alzheimer's disease; decreased cognitive function; Novel isolated fibroblast growth factor-like polypeptide useful for treating, preventing or ameliorating cirrhosis, inflammatory bowel disease, mucositis, Crohn's disease, diabetes, obesity, stroke and "Mature human FGF-like protein" "Signal peptide" Location/Qualifiers Claim 13; Fig 2; 138pp; English. 07-SEP-1999; 99US-00391861. 23-AUG-2000; 2000US-00644052. 05-SEP-2000; 2000WO-US024373 .209 /note= senile dementia; human. /note= WPI; 2001-226743/23. The invention relates to fibroblast growth factor (FGF)-like polypeptides and nucleic acid molecules encoding such polypeptides. Sequences of the invention are useful for treating, preventing or ameliorating a medical condition. They are useful for treating dermal wounds, epidermolysis, bullosa, male pattern alopecia, gastric ulcer, duodenal ulcer, erosive gastritis, oesophaguist, oesophagual reflux disease, inflammatory bowel disease, crohn's disease, radiation- or chemotherapy-induced gut toxicity, hyaline membrane disease, necrosis of the respiratory compitions, pulmonary fibrosis, chepatic cirrhosis, toxic insults to the liver, fulminant liver failure, viral hepatitis, mucositis, multiple sclerosis and other currhosis, toxic insults to the liver, fulminant liver failure, viral hepatitis, uncositis, multiple sclerosis and other currhosis, toxic insults to the liver, fulminant liver failure, bronchopulmonary dysplasia, acute respiratory distress syndrome or other currhosis modulating of the eye or the other tissues and organs. Cromorhopulmonary dysplasia, ecute respiratory distress syndrome or other currhosis, modulating differentiating or meliorate skin aging, promoting and skeletal muscle cells, preventing or ameliorate skin aging, preventing or and skeletal muscle cells, preventing or and differentiation of neuronal cells, disporytes the active distress and differentiation of neuronal cells, and differentiation of neuronal cells, disporytes or the context of the

For proteins regulate growth and differentiation of a variety of cell types. FGF-21 nucleic acids and polypeptides are useful for treating diseases and disorders characterised by inadequate numbers of hepatic cells, preferably cirrhosis of the liver. They may also be used in the treatment of infertility, impotence, and testicular cancer, as well as leukemia, lymphoma, autoimmune disease, or proliferative disorders of the
